

Simcenter Anovis NDT

Component testing solution for mass production

| Agenda

Simcenter Anovis

How does Acoustic Resonance Testing (ART) work?

Application examples

Simcenter Anovis: Portfolio

End Of Line Testing

Fault identification
Go/no Go decision

Examples:

- Engines, electric drive units
- Transmissions
- E-Motors and Assemblies

Non-destructive Testing

Resonance test
Cracks, porosity, density, ...

Examples:

- Powder metal parts
- Forging and casting parts
- Car Body parts

Process Monitoring

Breakage detection
Crack detection

Examples:

- Presses, punches
- Joining machines
- Mounting of electric plugs

Simcenter Anovis: System Overview

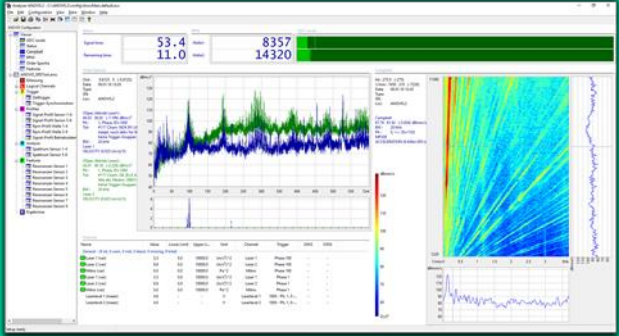

Hardware

- Anovis-SRD
- Impact device
- If required:
PCs, interface cards

Software

- Anovis-professional
- Anovis-lite
- Anovis-Chameleon
- ...

Sensors

- Microphones
- Accelerometers
- Laser vibrometers
- ...

Deployment Service

- Technical consulting
- Preliminary studies
- Commissioning
- Training
- After-sales support

How does Acoustic Resonance Testing (ART) work?

Application examples

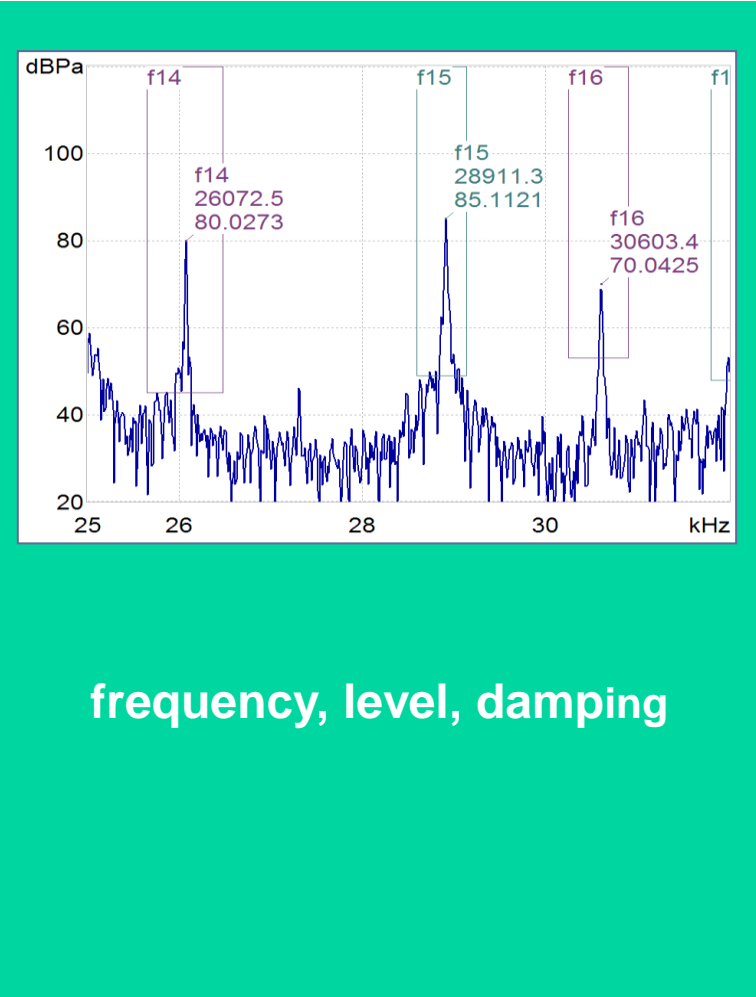

Principle of Acoustic Resonance Testing (ART)

ART evaluates the state
of a component based on
its natural frequencies.

Natural frequencies are
physical properties
of a component, which
are determined only by
its internal characteristics.

Conspicuous parts
are sorted out.

Principle of Testing with Anovis NDT

Typical (O.K.)

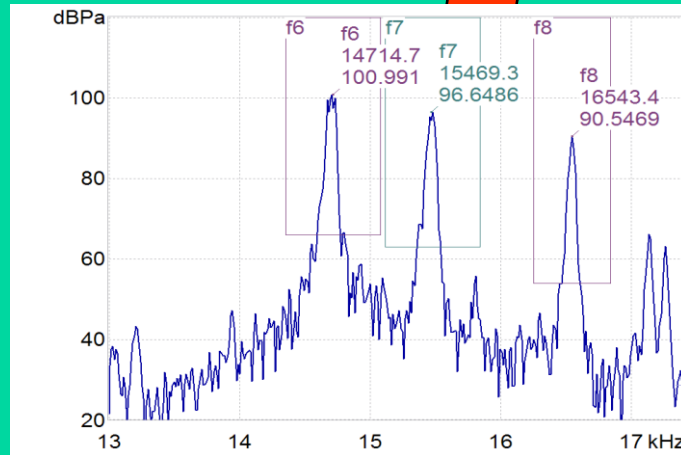

Typical (O.K.):	1161	99.40 %
Marginal (still O.K.):	2	0.17 %
Conspicuous (not O.K.):	5	0.43 %
Missing features (not O.K.):	0	0.00 %
Total:	1168	

assessment OK / NOK

Standard Measurement Chain of ART

- part settlement/slide
- sound excitation
- signal recording

- frequency analysis
- resonance frequency detection
- parameter determination

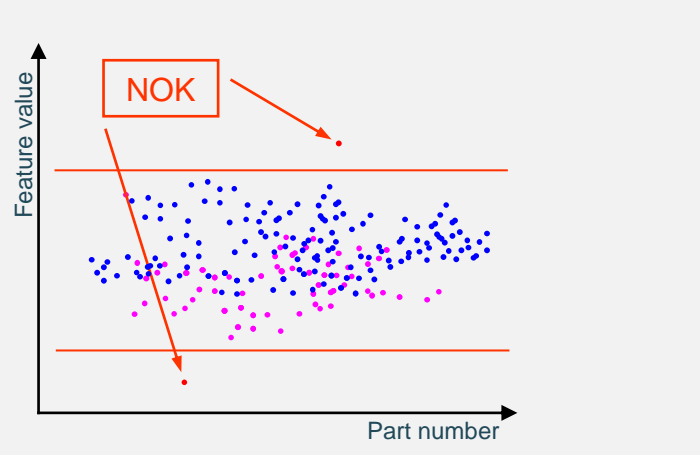

A screenshot of the 'Configuration frequency features' software interface. The interface shows a table of installed frequencies and a summary table. The summary table is as follows:

Category	Count
Typical (O.K.)	1161
Marginal (still O.K.)	2
Conspicuous (not O.K.)	5
Missing features (not O.K.)	0
Total:	1168

- derivation of metrics
- combination of metrics
- assessment OK/NOK

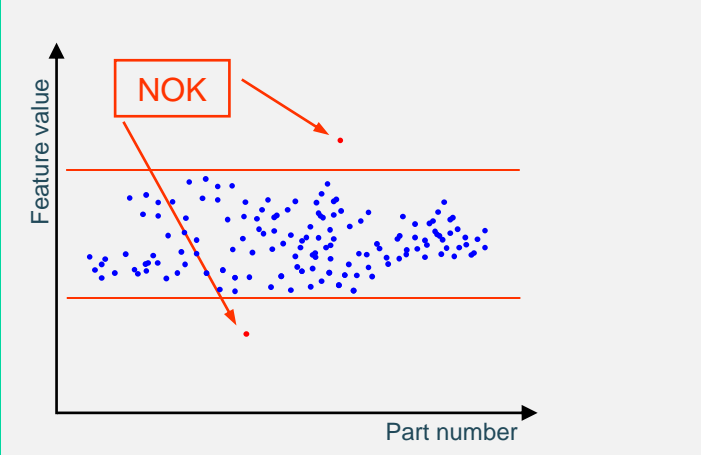

Test Regimes and Defect Detection for Anovis NDT

mixed lots: testing with globally fixed limits

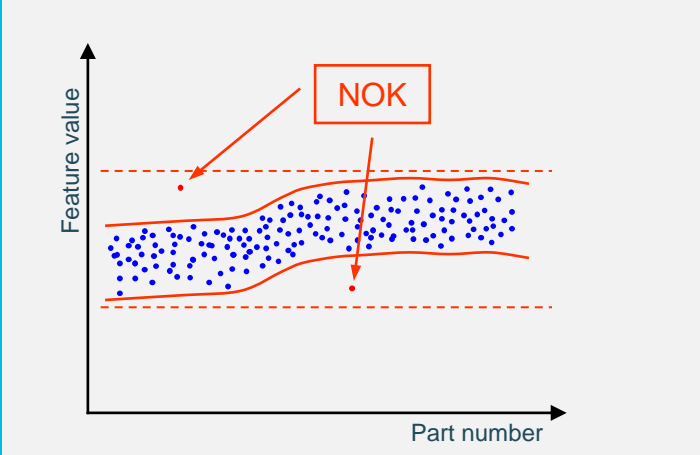

suitable for detection of large deviations

single lots: testing with fixed limits per production lot

increased sensitivity for defects

FIFO order: testing with drift adaptation

best defect detection

Reasons for Application of Anovis NDT

Process reliability

- reliable fault detection
- no pseudo rejects
- detection of yet unknown faults

100% Testing of production & product

- short cycle time for testing: approx. 1 second
- complete automation: normal way of implementation

Documentation of production

- clear assignment of test data to the tested component
- statistics that helps to improve the production process

Characteristics of Anovis NDT

Comparing method

- non-identifying
- non-locating
- full part assessment

Adaptation to the current production lot

- no master parts required
- no process-representative fault parts required
- universal test setup per part type

Benefits

- fast
- reliable
- automatable
- able to find unexpected faults

How does Acoustic Resonance Testing (ART) work?

Application examples

Application Example: Pulley Testing with Impact Device

Component testing, e. g. crack detection in a pulley part for electric power steering

- Sound excitation: impact device
- Sensor: broadband microphone
- Fully automatic, 100% testing, approx. 6 sec. cycle time, pass – fail decision
- Many companies use Simcenter Anovis NDT for testing of sintered parts (PM, MIM,...)

Application Example: Pulley Testing with Impact Device

Component testing, e. g. crack detection
in a cross-coupling part

- Sound excitation: slide device
- Sensor: broadband microphone
- Fully automatic, 100% testing, approx.
2 sec. cycle time, pass – fail decision
- Cast or forged parts are also tested
with Simcenter Anovis NDT
